In 2024, the global production of Water Spray Sterilization Retort is 9,121 units, with an average selling price of US\$66,000 per unit. A water spray sterilization retort utilizes high-temperature water to sterilize food through a spraying process. It is widely used for commercial sterilization of foods such as cans, flexible packaging, glass bottles, and tinfoil cans. Its operating principle is to spray heated water evenly onto the surface of the food packaging through a nozzle, achieving rapid and uniform heat transfer, thereby killing microorganisms and spores in the food and extending its shelf life. Compared to traditional water bath or steam sterilization methods, a water spray retort offers advantages such as faster heating, more uniform temperature distribution, energy efficiency, environmental protection, and adaptability to various packaging formats. This equipment is typically equipped with a PLC automatic control system, enabling multi-stage temperature curve control, backpressure protection, data logging, and remote monitoring, meeting the modern food industry's requirements for efficient, safe, and traceable sterilization processes.

The global Water Spray Sterilization Retort market size was estimated at USD 602.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
