Report Overview

Rising feed costs will drive advances as fishmeal and fish oil prices continue to grow rapidly, and the ongoing transition from extensive and semi-extensive to intensive aquaculture production supports greater feed demand. However, higher fish product prices -- due in large part to increasing feed costs -- will result in slower growth in global per capita fish consumption, and bring advances in world aquaculture demand to more sustainable levels. The corresponding moderation in world aquaculture output will be particularly significant in China, which is forecast to grow at a slower pace than not only the rest of the Asia/Pacific region, but also South America and the Africa/Mideast region.

The global Water Treatment For Aquaculture market size was estimated at USD 620.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
