## Abstracts

Water treatment flocculants and coagulants are chemical agents used to remove suspended particles, turbidity, and impurities from water in various treatment processes. Coagulants like aluminum sulfate (alum), ferric chloride, and polyaluminum chloride (PAC) destabilize the charges on suspended particles, causing them to clump together. Flocculants, such as polyacrylamide (PAM) and other polymer-based agents, enhance the aggregation of these clumps (flocs), making them larger and easier to separate from water through sedimentation or filtration. These chemicals are widely used in municipal water treatment, wastewater treatment, and industrial processes to improve water clarity, reduce contaminants, and meet regulatory standards for water quality.

The global Water Treatment Flocculants Coagulants market size was estimated at USD 6418.88 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
