Abstracts

The waterproof and breathable membrane for construction (commonly known as breathable waterproof membrane) is a material used for the exterior walls, roofs, foundations and other parts of buildings. Its main functions are waterproof and breathable, preventing moisture from penetrating into the interior of the building while allowing air and water vapor to be discharged from the interior of the building. This can effectively prevent moisture problems, mold growth, wall damage, etc. inside the building. This membrane is generally made of plastic materials such as polyethylene (PE) and polypropylene (PP). It has good weather resistance and UV resistance, and can adapt to different temperature and humidity conditions. Breathability helps keep the wall dry and avoid problems caused by water vapor accumulation. In construction, waterproof and breathable membranes are often used as exterior wall insulation systems, roof air barriers, basement waterproofing, etc. It is a very important protective layer in modern buildings, especially in waterproofing, heat preservation and moisture-proofing.

The global Waterproof Breathable Membrane for Construction market size was estimated at USD 5268.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
