Abstracts

A Wave Attenuator System is a structure or device designed to reduce the energy and impact of waves in bodies of water, such as oceans, lakes, and rivers. These systems help protect shorelines, harbors, marinas, floating structures, and coastal infrastructure from erosion and damage caused by wave action. Wave attenuators work by absorbing, dissipating, or redirecting wave energy, often through floating barriers, perforated breakwaters, or anchored pontoons that move with the waves. Some advanced systems use modular floating panels, flexible barriers, or artificial reefs to reduce wave height and intensity. They are commonly used in coastal engineering, aquaculture farms, renewable energy projects (wave energy converters), and waterfront developments to create calmer water conditions and enhance marine safety.

The global Wave Attenuator System market size was estimated at USD 104.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
