Abstracts

Wave remote sensing radar refers to a specialized category of radar systems designed to observe, measure, and analyze ocean and sea surface conditions by transmitting microwave signals and interpreting their backscatter to derive parameters such as wave height, wave direction, wave period, surface currents, and wind speed over water bodies. These systems operate on the principle that the roughness and motion of the sea surface modulate the returned radar signal, allowing for the extraction of quantitative geophysical data through advanced signal processing techniques, often deployed on satellites, aircraft, shore-based installations, or marine platforms to support applications in maritime safety, climate research, offshore operations, and coastal management.

The global Wave Remote Sensing Radar market size was estimated at USD 415.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
