Abstracts

Wavelength swept lasers are a specialized class of semiconductor lasers that rapidly and repeatedly tune their output wavelength across a broad spectral range, typically in the near-infrared region, producing a narrow-linewidth, coherent light source whose frequency changes continuously over time. Unlike fixed-wavelength lasers, these devices are engineered for high-speed sweeping capabilities, often achieving tuning rates of several kHz and covering bandwidths of tens to over 100 nm, with key performance metrics including sweep linearity, coherence length, output power stability, and tuning speed. Their operation relies on advanced mechanisms such as MEMS-tuned external cavities, Fourier domain mode locking (FDML), or dispersive filtering to achieve precise, repeatable wavelength scans.

The global Wavelength Swept Laser market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
