Abstracts

The wearable 3D motion capture system is a technological system capable of recording the movement posture and trajectory of the human body or objects in three-dimensional space. It primarily acquires motion data by installing sensors on key parts of the human body (such as joints, limbs, etc.) or on the surface of objects. These sensors can be various types, including inertial measurement units (IMUs), optical markers, magnetic sensors, and more. The system processes and analyzes the data collected by the sensors to reconstruct complete three-dimensional motion information, encompassing parameters such as the position, angle, velocity, and acceleration of the limbs. Furthermore, this information can be presented in a visual format.

The global Wearable 3D Motion Capture Systems market size was estimated at USD 257.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.60% during the forecast period.
