Report Overview

Wearable ECG equipment is a more convenient device for detecting ECG that can be used at home, providing heart health management services for doctors, patients, and sub-healthy people. In traditional medical equipment, monitoring heart rate and heart activity is accomplished by measuring electrophysiological signals and an electrocardiogram (ECG), which involves attaching electrodes to the body to measure signals of electrical activity induced in heart tissue. Electrocardiography (ECG) uses bioelectricity for detection, using electrodes attached to the surface of the human skin to detect the potential transmission of the heart. In each cardiac cycle, the heart is excited successively by the pacemaker, the atrium, and the ventricle, accompanied by changes in the action potentials of countless myocardial cells. These bioelectric changes are called ECG. By capturing bioelectric signals and then digitally processing them, they are transformed into After digital signal processing, it can output accurate and detailed heart health information. PPG refers to photoplethysmography (PhotoPlethysmoGraphy) to monitor heart rate. The principle is to irradiate the blood vessel with the green LED light of the smart wearable device and the photosensitive photodiode for a period of time. Since the blood is red, it can reflect the red light and absorb the green light. When the heart beats, the blood flow increases and the green light absorption It will become larger accordingly; the blood flow will decrease when the heart beats, and the green light absorbed will also decrease. Therefore, heart rate can be measured from the absorbance of blood. At present, the most common wearable ECG devices for heart rate measurement on the market use PPG technology.
