Abstracts

A wearable injector system is a self-contained, portable medical device designed to deliver a precise volume of liquid medication subcutaneously or intramuscularly over a predetermined period, ranging from minutes to several hours or even days. These systems typically consist of a drug reservoir, an on-body delivery mechanism?often driven by springs, gas generation, or osmotic pressure?and a user-friendly interface for activation, enabling patients to self-administer therapies outside clinical settings. They are engineered to enhance patient convenience, improve adherence to treatment regimens, and reduce healthcare burdens by replacing traditional infusion methods, such as syringes or IV lines, with discreet, automated alternatives suitable for chronic conditions, biologics, or high-volume therapeutics.

The global Wearable Injector System market size was estimated at USD 1192.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.35% during the forecast period.
