Report Overview:

Wearable Jetpack is a device worn on the back which uses jets of gas or liquid to propel the wearer through the air. With the exception of use in a microgravity environment, this thrust must be upwards so as to overcome the force of gravity, and must be enough to overcome the weight of the user, the jet pack itself and its fuel. This necessarily requires the jet pack to continually push mass in a downwards direction. While some designs have power and/or mass supplied from an external, ground-based source, untethered flight requires all of a flight's fuel to be carried within the pack. This results in problems relating to the overall mass ratio, which limits the maximum flight time to a few minutes, rather than the sustained flight envisaged in science fiction.

The Global Wearable Jetpack Market Size was estimated at USD 169.36 million in 2023 and is projected to reach USD 362.06 million by 2029, exhibiting a CAGR of 13.50% during the forecast period.
