## Abstracts

Weigh In Motion (WIM) systems are non-stop weighing technologies used to measure the dynamic weight of vehicles in motion, typically installed on or beneath road surfaces to capture axle weights, gross vehicle weights, vehicle classification, speed, and traffic volume data without requiring vehicles to stop or slow down significantly. These systems leverage various sensor technologies such as piezoelectric, bending plate, or fiber-optic sensors to collect real-time data, which is then processed and utilized for applications including pre-screening for weight enforcement, toll collection based on weight, infrastructure protection, freight management, and traffic monitoring. WIM systems are critical for ensuring compliance with weight regulations, reducing road damage caused by overweight vehicles, optimizing logistics operations, and enhancing overall transportation efficiency and safety.

The global Weigh In Motion Systems market size was estimated at USD 1120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
