Abstracts

Welded feedthrough capacitors are specialized passive electronic components designed to provide high-frequency noise suppression and filtering in electrical circuits while ensuring a hermetic seal when mounted through a panel, chassis, or enclosure; they consist of a capacitor element—typically a ceramic or film dielectric—integrated within a metal casing that is welded or brazed to create a vacuum- or gas-tight barrier, making them essential in applications demanding electromagnetic interference (EMI) and radio frequency interference (RFI) mitigation alongside environmental protection, such as in aerospace, military, medical, and high-reliability industrial systems where leakage, corrosion, or signal integrity could compromise performance.

The global Welded Feedthrough Capacitor market size was estimated at USD 58.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
