Report Overview

Welding is among several key application areas of respiratory protective equipment. Workers in the welding industry including welders, solderers, and brazers are exposed to various occupational hazards such as intense visible light and harmful radiation, burns, sparks, and airborne particulate matter. In addition, workers face risks such as lung cancer, changes in lung functions, airway irritation, pulmonary infections, and bronchitis. Such hazards to the respiratory system can be avoided using welding respiratory systems.

According to the report, one driver in market is demand from manufacturing industry. Welding is an integral part of the manufacturing activities such as metal-joining, repairs, fabrication of door frames, fabric metal product manufacturing, transportation equipment manufacturing, and joining automotive parts. The manufacturing industry is a key employer worldwide and accounts for around 60% of all welding, cutting, and soldering activities globally. Welding emits harmful fumes and gases that are hazardous to humans and cause various lung and respiratory disorders. Automotive parts manufacturing industry commonly use metal inert gas welding to repair bikes, cars, and recreational vehicles. Metal inert gas welding is also commonly used in the manufacturing industry as it can be done on various metals including steel, aluminum, carbon steel, nickel, and other alloys. Hazards associated with this type of welding includes emission of both gaseous and particulate fumes. Prolonged exposure to large volumes of these fumes can cause various lung disorders. This has increased the consumption volume of respiratory protection systems for welders.
