Abstracts

A wet blood thawing machine is a specialized medical device designed to safely and efficiently thaw frozen blood products, such as plasma, platelets, or cryoprecipitate, by immersing them in a temperature-controlled water bath or using a water-based circulating system. These machines ensure uniform heating, prevent overheating or localized hot spots that could damage blood components, and often feature alarms, timers, and digital controls to maintain compliance with regulatory standards for transfusion safety. By automating and standardizing the thawing process, they reduce human error, save time in clinical settings, and help preserve the biological integrity of blood products intended for patient use.
