Abstracts

Wet process LIB separators are porous membranes, typically composed of polyethylene, polypropylene, or ceramic-coated materials, engineered to physically isolate the anode and cathode within a lithium-ion battery while facilitating ionic transport via liquid electrolyte immersion. These separators must exhibit high mechanical strength, thermal stability, and uniform pore structure to prevent internal short circuits and ensure consistent electrochemical performance. They are distinct from dry-process separators in their manufacturing method, which involves solvent-based extrusion and phase separation, resulting in finer pore structures and enhanced wettability?critical for high-power and high-energy-density battery applications such as electric vehicles and grid storage.

The global Wet Process Lib Separators market size was estimated at USD 780.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
