Report Overview

A wheel trencher consists of a wheel with a number of buckets attached sitting atop a set of crawler tracks. The wheel rotates as it approaches the ground and the bucket it used for digging the dirt from the trench. The buckets move in one continuous stream and when the bucket reaches the highest point it can reach, the dirt is tipped out of the bucket and is removed through a chute onto a conveyor belt that runs laterally to the wheel. The process is consistently occurring as the crawler feet move in the direction the trenches are being excavated.
