## Abstracts

White coal is a term commonly used to refer to a form of fuel that is produced from organic biomass or agricultural waste. It is also known as "bio-coal" or "agro-coal." The process of producing white coal involves the conversion of agricultural residues, such as crop residues, wood waste, and other organic materials, into a solid fuel with properties similar to traditional coal. Increasing global awareness of environmental issues and the growing demand for renewable energy sources drive the adoption of white coal. As a biomass-derived fuel, white coal aligns with the demand for cleaner and sustainable energy alternatives. White coal is known for its high calorific value, which makes it an attractive alternative to traditional coal. Industries seeking efficient and high-energy fuels may choose white coal for its combustion properties. The consistent and reliable supply of biomass feedstock poses challenges. Factors such as seasonal variations in agricultural waste availability and logistical issues in collecting and transporting biomass to production facilities can impact the steady production of white coal. White coal production often involves utilizing agricultural waste, providing economic opportunities in rural areas. This decentralized approach contributes to rural development, job creation, and enhanced income for farmers.

The global White Coal market size was estimated at USD 962.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
