## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Whitening Agent for Profiles competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Whitening agents for profiles are chemical additives specifically used to enhance the whiteness and brightness of profiles (such as plastic, metal, and other materials). Whitening agents absorb ultraviolet light through optical action and re emit blue light, making objects appear whiter and brighter. They are commonly used in the production of plastics, coatings, textiles, and other materials to enhance the appearance and visual effects of products. Whitening agent is the most commonly used whitening aid by many plastic, coating, and dyeing and finishing manufacturers, with the characteristics of small addition amount and obvious whitening effect. Especially in the hands of recycling manufacturers, it has become a good medicine for revitalizing products. When recycling PVC profiles, yellowing usually occurs. Some manufacturers choose to use titanium dioxide for whitening, but after adding a large amount of titanium dioxide, it cannot be made into pure white. Due to the excessive amount added, the quality of the plastic has also declined, making it incomparable to new raw materials.

The global Whitening Agent for Profiles market size was estimated at USD 403.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
