Abstracts

Whole Exome Sequencing (WES) Service is a specialized high-throughput sequencing service focused on analyzing the exonic regions of the genome, which comprise the protein-coding portions accounting for approximately 1%?2% of the human genome. This service is widely used in genetic research, rare disease diagnostics, cancer mutation profiling, and precision medicine. By employing targeted capture and deep sequencing technologies, WES enables the comprehensive detection of genetic variants such as single nucleotide variants (SNVs) and small insertions/deletions (indels), offering a cost-effective yet information-rich approach. A standard WES service includes sample preparation, library construction, target enrichment, sequencing, quality control, variant calling, functional annotation, and clinical interpretation. Whole Exome Sequencing is a powerful tool for identifying disease-associated mutations, discovering novel genes, and guiding personalized treatment strategies, playing a crucial role in both medical genetics and translational research.

The global Whole Exome Sequencing Service market size was estimated at USD 2651.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.60% during the forecast period.
