### Report Overview:

Whole Genome Sequencing sequences the complete DNA of an organism. In the case of a human this corresponds to about three billion base pairs of DNA. Whole genome sequencing entails sequencing all coding (exons) and noncoding (intron) nuclear DNA as well as mitochondrial DNA. This allows researchers to generate large quantities of data, which can then be analyzed. The exome makes up only 1.5% of the whole human genome, however ALL protein coding genes are found in the exome. Since most genetic disorders are correlated with mutations in protein coding genes, most physicians and scientists who use sequencing technologies for diagnostic purposes start with an analysis of the exome.

The Global Whole Genome and Exome Sequencing Market Size was estimated at USD 327.07 million in 2023 and is projected to reach USD 625.11 million by 2029, exhibiting a CAGR of 11.40% during the forecast period.
