Abstracts

Wide molybdenum target refers to a large-format sputtering target composed predominantly of high-purity molybdenum, used in physical vapor deposition (PVD) processes to deposit thin, uniform molybdenum-based coatings onto substrates such as glass, semiconductors, and display panels. These targets are characterized by their substantial dimensions, high density, exceptional thermal stability, and low impurity levels, which are critical for achieving consistent film quality, adhesion, and electrical performance in applications including flat panel displays, solar cells, and architectural glass coatings. The production of wide molybdenum targets involves advanced powder metallurgy, hot isostatic pressing, and precision machining to meet stringent industry specifications for grain structure, purity (often >99.95%), and dimensional tolerances.

The global Wide Molybdenum Target market size was estimated at USD 220.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
