Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on WiFi6 Wireless Router competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of WiFi 6 wireless routers reached 86.23 million units, with an average selling price of \$30.56 per unit. Wi-Fi 6 wireless routers are sixth-generation wireless LAN devices based on the IEEE 802.11ax standard, with a theoretical peak speed of 9.6 Gbps. Through technologies such as OFDMA, uplink and downlink MU-MIMO, 1024-QAM, and TWT, they achieve high throughput, low latency, and low power consumption for concurrent access in densely populated terminal scenarios, while also being backward compatible with 802.11a/b/g/n/ac terminals. The core components of a Wi-Fi 6 wireless router are the SoC (System-on-a-Chip) controller (Qualcomm/Broadcom/HiSilicon, etc.), Wi-Fi 6 baseband and RF front-end, 256 MB or more of DDR memory and 128 MB or more of NAND Flash, four- or six-layer PCB, 4-8 high-gain antennas, gigabit Ethernet transformer, plastic casing, and aluminum heat sink. The main chip, priced at \$8-10, accounts for the highest percentage of the BOM (Bill of Materials). Direct materials for the entire system cost approximately 35-50 RMB, representing about 80% of the factory cost. The cost structure exhibits a "high materials, low labor" characteristic: raw materials 80%-85%, labor 5%-8%, and manufacturing and testing 7%-10%. Therefore, fluctuations in the prices of the main chip, memory, and copper have the greatest impact on the overall profit margin.

The global WiFi6 Wireless Router market size was estimated at USD 2635.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
