## Abstracts

The modern industrial sector has a huge demand for lubrication systems, among which centralized lubrication systems, as a key component of the wind power industry, are vital to modern enterprises. Wind power centralized lubrication systems are generally composed of lubrication pumps, distributors (such as progressive distributors), pipeline components, control systems, filter elements, oil tanks and other parts. These components work together to ensure that lubricating grease can be delivered to various lubrication points in wind turbines in a timely and quantitative manner. A core advantage of wind power centralized lubrication systems is that they can significantly reduce equipment wear. This feature is crucial because it helps to significantly extend the service life of machines and equipment. In the long run, this saves companies a lot of money in equipment replacement and repair. Secondly, another significant benefit of using wind power centralized lubrication systems is improved efficiency. By ensuring that the machine is fully lubricated, the system makes the machine run more smoothly and friction is greatly reduced. This optimization directly improves productivity and enables companies to complete production tasks more efficiently.

The global Wind Power Centralized Lubrication System market size was estimated at USD 160.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
