Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Wind Power Torque Limiter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A wind power torque limiter is a protective mechanical device used in wind turbines to prevent drivetrain components—such as the gearbox, generator, and shafts—from being damaged by sudden overloads or excessive torque caused by gusts, grid faults, or braking events. It functions by slipping, disengaging, or limiting the torque transmitted when loads exceed a preset threshold, thereby absorbing or releasing excess energy before it reaches critical components. Common types include friction, shear pin, and safety coupling designs, each balancing reliability with ease of reset or replacement. By acting as a fail-safe, torque limiters enhance turbine durability, reduce downtime, and lower maintenance costs, making them essential for ensuring stable operation and extending the lifespan of wind energy systems. The product sells about 40,000 units a year, each costing about \$10,000. The upstream of wind power torque limiters mainly involves raw materials such as high-strength steel, specialty alloys, friction materials, and precision springs, along with machining, casting, and heat-treatment processes supplied by metal fabricators, component makers, and industrial equipment providers. The downstream consists of wind turbine OEMs and drivetrain integrators who incorporate torque limiters into gearboxes, couplings, or shaft assemblies, as well as wind farm developers, operators, and maintenance service providers who depend on these devices to ensure reliability, reduce downtime, and extend the operational life of turbines.

The global Wind Power Torque Limiter market size was estimated at USD 396.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30%

during the forecast period.
