Report Overview

The windproof tie rod is a component used for port machinery, especially container cranes, which helps to prevent damage caused by strong winds. The pull rod is a slender steel rod, which is connected to the trolley of the crane and extends to the edge of the crane boom. The pole is designed to counteract the effect of wind by providing a stable force that helps to maintain the stability of the crane. During operation, the wind tie rod is usually kept in the horizontal position. When strong wind is detected, the pull rod can be adjusted to help reduce the wind resistance of the crane and stabilize the angle of the crane to resist the wind. This helps prevent the crane from swinging or tilting, which may damage the crane, the container it carries, and even the surrounding structure.
