Report Overview

The global fossil fuel dependency is expected to cause significant social and economic fluctuations. An economy that is based on fossil fuel is highly unsustainable. The efforts taken to reduce such an impact and reduce its usage and dependence has paved way for alternate and renewable sources of energy. Alternate sources, such as wind energy, is one of the most sought after options since it is the least expensive power generating option. Increasing number of locations for capacity additions in newer markets such as Africa, Asia, Central, and South America is driving the wind power generation. Both onshore and offshore wind power generation have contributed to the improvement of wind energy's economics in varied operating conditions and wind regimes.

According to the report, the offshore wind is consistent and powerful, and has higher wind speed and fewer environmental concerns. Offshore wind projects are suitable for large-scale development that can lead to increased demand for wind turbine components. Also, floating turbine is another prospect for the future, which will significantly contribute to wind installation. A floating wind turbine is an offshore wind turbine that is mounted on a structure and can float in the ocean, thereby allowing for wind power generation in difficult ocean terrains.
