Report Overview

Gearboxed variable speed wind turbines have a gearbox between the low speed rotor and the high speed generator (usually a relatively standard doubly fed induction generator). The purpose of the gearbox is to increase the rotor speed before feeding it into the generator. The generator speed of a direct drive wind turbine is equal to the rotor speed because the rotor is directly connected to the generator. Due to the low rotational speed of the generator, the designers placed several poles in the generator to achieve a suitably high output frequency.
