Report Overview

Wind turbine inspection drones are unmanned aerial vehicles catering to the civilian segment of end-users. They are used to gather information and images of wind turbine blades, nacelles, and towers.

According to the report, one driver in market is promotion of wind energy due to renewability. With an increased focus on sustainability and environmental conservation, there is an increased focus on green energy initiatives. Currently, there are over 900,000 wind turbines installed globally. Some countries like Denmark meet all their energy needs using wind power. As wind energy is increasingly favored due to its renewability over alternatives such as fossil fuels, the demand for maintenance services will also gain traction. In turn, more companies will switch to technologically advanced inspection services involving wind turbine inspection drones to detect regular deterioration and the pre-end-of-warranty condition of turbine parts. This is to ensure that energy generation is not uninterrupted, and there is a reduction in downtime arising from inspection and maintenance.
