Abstracts

The wind turbine main bearing is a critical component located in the nacelle of a wind turbine, serving as the primary load-bearing element that supports the main shaft and rotor assembly while enabling smooth rotation under extreme dynamic and static loads, including variable wind forces, gravitational stresses, and operational torque. These bearings are engineered to withstand harsh environmental conditions, such as temperature fluctuations, moisture, and contamination, while maintaining precision alignment and minimal friction over extended operational lifespans, often exceeding 20 years. Typically designed as large-diameter slewing or spherical roller bearings, they are integral to power transmission efficiency and overall turbine reliability, with failure often leading to costly downtime and repairs. Advances in materials, lubrication systems, and predictive maintenance technologies continue to drive innovation in this segment, emphasizing durability and performance optimization in both onshore and offshore wind applications.

The global Wind Turbine Main Bearings market size was estimated at USD 4200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
