### Report Overview:

As the name implies, CMS' automatically monitor asset condition to provide an early fault detection system. In many cases a more detailed monitoring of the wind turbine drivetrain, such as vibration and oil condition analysis, is missing. A good condition monitoring system brings added value by addressing potential faults early. A great condition monitoring system can differentiate false alarms, operate reliably in stand-alone mode, and provide on-point information on the real drivetrain condition, enabling reliable operation. CMS enables the detection of operating conditions that, if left unchecked, result in shortening the lifespan of equipment and develop to a major failure. CMS' have proven their worth repeatedly as a part of cost-efficient and effective wind turbine O&M. Preventing even only one gearbox failure can repay the entire system, in addition to optimizing O&M scheduling. A condition monitoring system also enables the monitoring of the wind turbine while in operation, instead of shutting it down for a day to conduct inspections.

The Global Wind Turbine Monitoring Systems Market Size was estimated at USD 102.77 million in 2023 and is projected to reach USD 181.08 million by 2029, exhibiting a CAGR of 9.90% during the forecast period.
