Abstracts

Window insulation film is a thin, transparent plastic sheet applied to the interior of windows using double-sided tape and then shrunk taut with heat from a hairdryer to create an insulating air gap that reduces heat transfer, drafts, and condensation. It functions as a cost-effective, temporary solution to improve energy efficiency in residential and commercial buildings by minimizing heat loss in winter and heat gain in summer, often serving as an alternative to more permanent upgrades like double-pane windows. The material is typically made from polyester or polyethylene and may feature low-emissivity coatings to enhance thermal performance.

The global Window Insulation Film market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
