## Abstracts

Wine Bacteria refers to lactic acid bacteria and other microorganisms involved in the winemaking process, mainly including lactic acid bacteria (such as *Streptococcus thermophilus* and *Lactococcus lactis*) and acetic acid bacteria. Lactic acid bacteria play a key role in malolactic fermentation (MLF), reducing the acidity of wine and improving taste and stability by converting malic acid into lactic acid and carbon dioxide. Acetic acid bacteria may increase the acetic acid content and affect the quality of wine. Proper management of these bacteria is crucial to the optimization of wine flavor and the success of brewing.

The global Wine Bacteria market size was estimated at USD 365.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
