Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Wing-in-Ground Effect Craft (WIG Craft) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Wing-in-ground effect crafts (WIG Crafts) are hybrid transport vehicles that utilize the ground effect to achieve efficient, high-speed cruising at low altitudes close to water/land. Their core demand stems from the need to fill the market gap between the low speed of traditional ships and the high cost of aircraft; that is, to achieve high-speed, stealthy maneuverability with a payload of hundreds of tons at altitudes of hundreds of kilometers above the sea surface without the need for runways, meeting the strategic and commercial logistics needs in specific scenarios. The upstream supply chain for GEVs encompasses the research and development and manufacturing of high-performance aerospace composite materials, high-power lightweight turbofan/turboprop engines, flight control systems, and special hull materials. The downstream supply chain directly serves special transport and mission system integrators. End users include military departments (such as rapid troop deployment and anti-ship warfare), government agencies (such as maritime patrol and disaster relief), and high-end commercial operators (such as inter-island high-speed logistics and luxury tourism) requiring high-speed, low-cost, and high-payload amphibious transport capabilities. In 2024, approximately 15 WIG crafts were produced, with an average selling price of approximately US\$10 million per aircraft and a gross profit margin of approximately 30%.

The global Wing-in-Ground Effect Craft (WIG Craft) market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
