Report Overview

Winter tires are tires designed for use in colder weather, snow and ice. Winter tires have more sipes than summer tires, increasing traction on snow and ice. Tires designed for winter conditions are optimized to drive at temperatures below 7 °C (45 °F). They are an alternative to the use of snow chains. Winter tires are usually tires with a different rubber composition from all-weather (all-season) tires. Cold-weather tires include a greater percentage of natural rubber and silica so there is not as much hardening as found in synthetic rubber in cold conditions: they provide better traction at lower temperatures.
