Abstracts

Wire bonding equipment refers to specialized machinery used in semiconductor manufacturing to create electrical interconnections between integrated circuits (IC) and their packaging or substrates through the formation of fine, ultra-thin wires (typically gold, copper, or aluminum) that are thermally or ultrasonically bonded to contact pads; this process is critical for ensuring signal integrity, power distribution, and mechanical stability in microelectronic devices such as CPUs, memory chips, sensors, and power modules. The equipment encompasses various system types, including ball bonders, wedge bonders, and advanced hybrid bonders, which differ in bonding techniques, wire materials, and precision capabilities, with modern systems integrating high-resolution vision alignment, real-time process monitoring, and automation features to meet the demands of increasingly miniaturized and complex semiconductor designs.
