Abstracts

A skateboard is a type of configuration for automotive chassis, used for automotive platforms of battery electric vehicles. The skateboard chassis includes a base structure or a platform, which houses the batteries, electric motors and other electronic components fundamental to an electric vehicle. Wire control technology refers to a technology that transmits control by "wires" or electrical signals, replacing the "hard" connection of traditional mechanical connection devices to achieve control. The control-by-wire chassis consists of five major systems: steering, braking, gear shifting, accelerator, and suspension. The wire control system cancels some bulky and low-precision pneumatic, hydraulic and mechanical connections, and replaces them with sensors, control units and electromagnetic actuators driven by electrical signals, so it has the advantages of compact structure, good controllability and fast response speed. The implementation process of the wire control technology: the sensor converts the driver"s manipulation command into an electrical signal and sends it to the controller. The controller analyzes the signal and sends the command to the actuator, and finally the functional device realizes the target command.From the perspective of industry development, electrification is the future trend, and motor modularization, battery embedded chassis, and overall chassis configurability are the future development directions. With the rich and varied rhythms and preferences of consumers, in order to cater to the ever-changing trends, manufacturers try to reduce costs as much as possible, shorten the development cycle, and generalize parts and reduce the number of parts. The future car disputes will be more of a post-service era such as customer interaction. The profit and cost of design and manufacturing will be kept very low. Chassis is the most important part of a car, and the skateboard chassis came into being.

The global Wire Control Skateboard Chassis market size was estimated at USD 8970.0
