Report Overview

A skateboard is a type of configuration for automotive chassis, used for automotive platforms of battery electric vehicles. The skateboard chassis includes a base structure or a platform, which houses the batteries, electric motors and other electronic components fundamental to an electric vehicle. Wire control technology refers to a technology that transmits control by 'wires' or electrical signals, replacing the 'hard' connection of traditional mechanical connection devices to achieve control. The control-by-wire chassis consists of five major systems: steering, braking, gear shifting, accelerator, and suspension. The wire control system cancels some bulky and low-precision pneumatic, hydraulic and mechanical connections, and replaces them with sensors, control units and electromagnetic actuators driven by electrical signals, so it has the advantages of compact structure, good controllability and fast response speed. The implementation process of the wire control technology: the sensor converts the driver's manipulation command into an electrical signal and sends it to the controller. The controller analyzes the signal and sends the command to the actuator, and finally the functional device realizes the target command.

The global Wire Control Skateboard Chassis market size was estimated at USD 6357 million in 2023 and is projected to reach USD 26117.10 million by 2032, exhibiting a CAGR of 17.00% during the forecast period.
