Abstracts

Wire Mesh Inclined Screen is a screening device that consists of a wire mesh stretched over a frame and set at an inclined angle. The wire mesh is typically made of metal wires such as stainless steel or other suitable alloys. The inclined design allows materials to be fed at the higher end and move downwards under the influence of gravity. As the materials flow down the inclined wire mesh, the screen separates the particles based on their size. Smaller particles pass through the openings of the wire mesh, while larger particles are retained on the surface of the mesh and are transported to the lower end for further processing or disposal. It is commonly used in industries such as mining, quarrying, food processing, and waste treatment for the initial separation and classification of granular materials.

The global Wire Mesh Inclined Screen market size was estimated at USD 352.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
