## Abstracts

Wire wound chip reactors are inductors in which wires are wound on a magnetic core to form an inductive coil. It is characterized by a wide range of inductance (mH~H), high inductance accuracy, low loss (that is, large Q), large allowable current, and manufacturing process. Strong inheritance, simplicity, low cost, etc., but the disadvantage is that it is limited in further miniaturization. Wirewound chip reactors are one of the most effective and simple filter types and are widely used in many areas of electronic equipment, which is the major driving factor for the market growth. Wirewound reactors are increasingly used in electronic equipment to reduce electromagnetic interference, and due to their many advantages, there is an increasing demand for wirewound reactors, military and aerospace systems and subsystems, appliances, factories, etc. Surging adoption of ferrite chokes in automation equipment and many other devices along with increasing use of wound chip reactors in the transportation and automotive industries is expected to improve market growth over the forecast period.
