## Abstracts

A wired intraoral IOL (Intra-Oral Lens) scanner is a dental imaging device used to capture highly detailed, three-dimensional images of a patient's oral cavity. Unlike traditional impression techniques, which can be uncomfortable and time-consuming, the intraoral scanner allows for quick and precise digital impressions. The "wired" aspect refers to its connection to a computer or imaging system via a physical cable, ensuring a stable and uninterrupted data transfer during scanning. This technology enhances the accuracy of dental restorations, such as crowns, bridges, and implants, by providing clinicians with exact digital models. The high-resolution images and efficient workflow facilitated by the scanner contribute to improved patient comfort and more precise treatment outcomes.

The global Wired Intraoral IOL Scanner market size was estimated at USD 396.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
