Abstracts

Wireless 3D scanning systems are portable, non-contact devices that capture the physical geometry of objects or environments using technologies such as laser triangulation, structured light, or photogrammetry, and transmit data wirelessly (via Wi-Fi, Bluetooth, or cellular networks) to computers or cloud platforms for processing, visualization, and analysis. These systems eliminate the need for cables, enhancing mobility and operational flexibility in applications ranging from industrial metrology and reverse engineering to cultural heritage preservation, healthcare, and virtual reality. The integration of wireless connectivity enables real-time data sharing, remote collaboration, and streamlined workflows, making them particularly valuable in field-based or large-scale scanning scenarios where tethered systems would be impractical.

The global Wireless 3D Scanning System market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.75% during the forecast period.
