Abstracts

A wireless accelerometer is an electromechanical device that measures proper acceleration, the rate of change of velocity relative to its own rest frame, and transmits this data wirelessly via protocols such as Bluetooth, Wi-Fi, Zigbee, or LoRaWAN without the need for physical wired connections. It typically consists of a microelectromechanical systems (MEMS) sensor that detects static or dynamic acceleration forces along one, two, or three axes, integrated with signal conditioning circuitry, a microcontroller for data processing, and a wireless communication module. These devices are widely used to monitor vibration, tilt, shock, and motion in applications ranging from industrial machinery condition monitoring and structural health assessment to consumer electronics, wearable fitness trackers, automotive safety systems, and IoT-enabled smart devices, providing real-time, remote data acquisition and enabling predictive maintenance, activity tracking, and operational efficiency improvements.

The global Wireless Accelerometer market size was estimated at USD 950.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
