Report Overview:

In a wireless network, an AP is a networking hardware device that transmits and receives data. An AP connects users to other users within the network as well as serve as the interconnection point between the WLAN and a fixed wire network. Each AP can serve multiple users within a defined network area. When a person moves beyond the range of one AP, they are inevitably handed over to the next AP. A small WLAN requires a single AP; the number needed increases as a function of the number of network users and the physical size of the network.
