Abstracts

A wireless ballbar system is an advanced metrology instrument used for the performance verification and calibration of computer numerical control (CNC) machine tools, measuring geometric errors such as circularity, squareness, and backlash without the constraints of cables. It consists of a telescopic bar with precision balls at each end, which magnetically attach to a machine's spindle and table, while an integrated wireless transducer captures positional data as the machine executes a circular test path. By eliminating wired connections, it enhances operational flexibility, reduces setup time, and minimizes interference risks, making it particularly valuable in high-volume manufacturing environments, aerospace, and automotive sectors where frequent, efficient machine diagnostics are critical to maintaining production accuracy and minimizing downtime.

The global Wireless Ballbar System market size was estimated at USD 18.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
