Abstracts

Wireless capsule endoscopy is a non-invasive diagnostic medical procedure that involves the patient swallowing a small, pill-sized capsule equipped with a miniature camera, light source, transmitter, and battery; as the capsule travels naturally through the gastrointestinal tract, it captures and wirelessly transmits high-quality images of the mucosa to an external data recorder worn by the patient, allowing clinicians to visualize areas of the small intestine that are difficult to access with traditional endoscopic methods, primarily aiding in the detection of sources of bleeding, inflammatory bowel disease, celiac disease, tumors, and other abnormalities without the discomfort, sedation, or risks associated with conventional endoscopy.

The global Wireless Capsule Endoscopy market size was estimated at USD 665.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
