Abstracts

Wireless charging coils, also known as induction coils or transmitter/receiver coils, are essential components in inductive charging systems that enable the transfer of electrical energy from a power source to a device without physical connectors, utilizing the principle of electromagnetic induction to convert electrical current into a magnetic field, which is then reconverted back into electrical current by a corresponding receiver coil in the compatible device. These coils are typically constructed from copper wire wound into specific patterns and are often integrated with ferrite materials to enhance magnetic flux efficiency and minimize energy loss, with their performance heavily dependent on factors such as coil design, alignment, quality of materials, and compliance with established standards like Qi, which dominates the consumer electronics market for low to mid-power applications, while evolving technologies explore higher power transfer and longer-range capabilities.

The global Wireless Charging Coils market size was estimated at USD 2550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
