## Abstracts

The wireless charging system for industrial mobile robots refers to a system that transfers energy through an electromagnetic field, enabling electric power transmission between the charger and the industrial mobile robot without physical contact. It primarily consists of components such as transmitting coils, receiving coils, and controllers. The advantages of wireless charging include eliminating the need for manual intervention, reducing the layout of charging cables, enabling a more flexible production line configuration, and the ability to operate in harsh environments. In hazardous work environments such as coal mines and chemical plants, it avoids the safety hazards associated with contact charging. Among these, static charging involves a fixed relative position between the transmitting end and the receiving end, resulting in high electric power transmission efficiency. However, robots need to travel to a fixed area at specific times to stop and charge. In contrast, dynamic charging allows robots to charge while in motion, which is technically challenging but significantly enhances operational efficiency, enabling uninterrupted operation.

The global Wireless Charging Systems for Industrial Mobile Robots market size was estimated at USD 345.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
