Abstracts

A wireless differential pressure transmitter is an instrument used to measure the difference between two pressures. It usually consists of a sensor and signal transmission device, which obtains a result by measuring the pressure difference between two pressures, and transmits the result to the receiving device for display or processing. Traditional differential pressure transmitters need to be connected to the control system through cables, which limits their application scope. In the future, wireless differential pressure transmitters will be equipped with wireless transmission technology to achieve more convenient and efficient data transmission and monitoring.

The global Wireless Differential Pressure Transmitter market size was estimated at USD 1909.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
