## Abstracts

The wireless EEG machine is a device that records electrodes in contact with the scalp to extract brain bioelectric signals generated by brain tissue activity. It utilizes electronic computer analysis and imaging technology to convert these signals into colored images or data in forms that can both locate and quantify them. This device can visually display various parameters of different brain regions and assess brain function status, thereby assisting doctors in improving the accuracy of neurological disease diagnosis and providing a basis for clinical medical diagnosis or experimental research. The overall operation of the device is simple, with strong anti-interference capabilities, high sensitivity, and good portability. It is widely used in medicine, neuroscience, and other fields. Wireless EEGs can be classified in multiple ways. According to the number of channels, they can be divided into low-channel types (less than 8) and multi-channel types (more than 8, mainly 16/24/32 channels). Based on battery life: less than 6 hours and 6 hours or more. According to storage methods: local SD card or saving to a PC.

The global Wireless EEG Machines market size was estimated at USD 472.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
